# Maze Segments

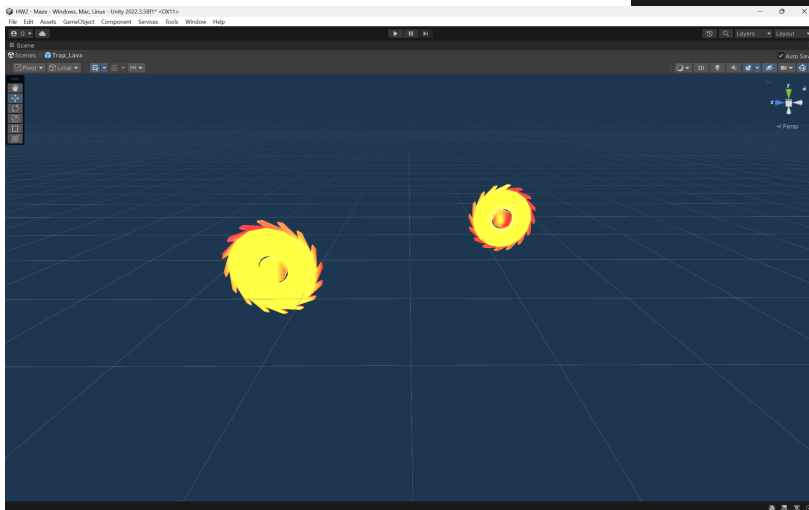

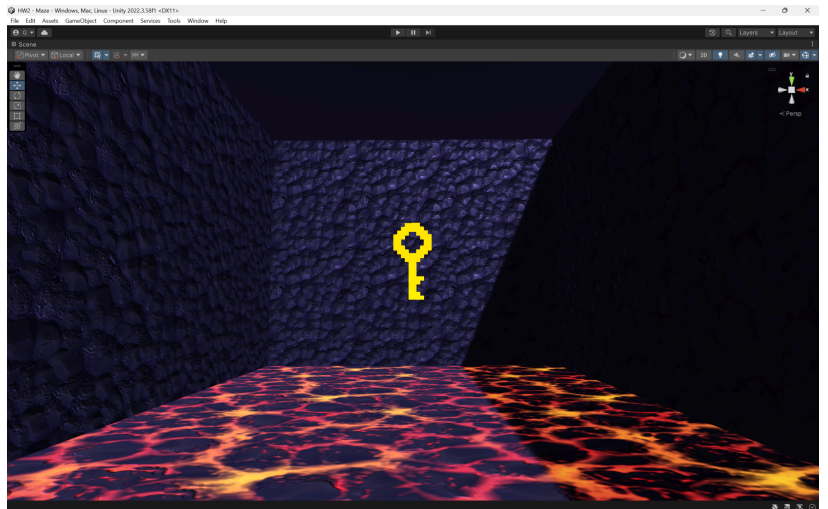

## Lava Segment

This part damages the player all the time. The damage is inversely proportional to the player's speed. If the player doesn't move at all, he/she will quickly run out of health. The best strategy here is to run at all times.

## Key

This key gets automatically picked-up on colliding with it. This one doesn't require any physical force to activate.

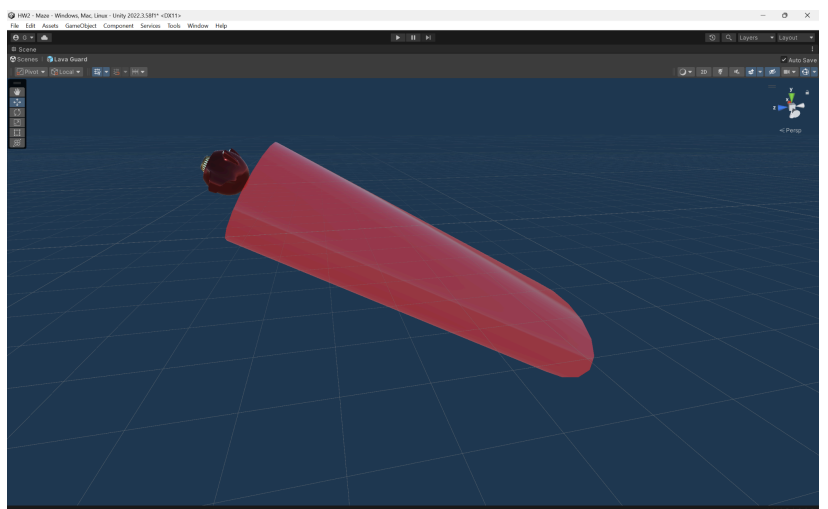

## Trap

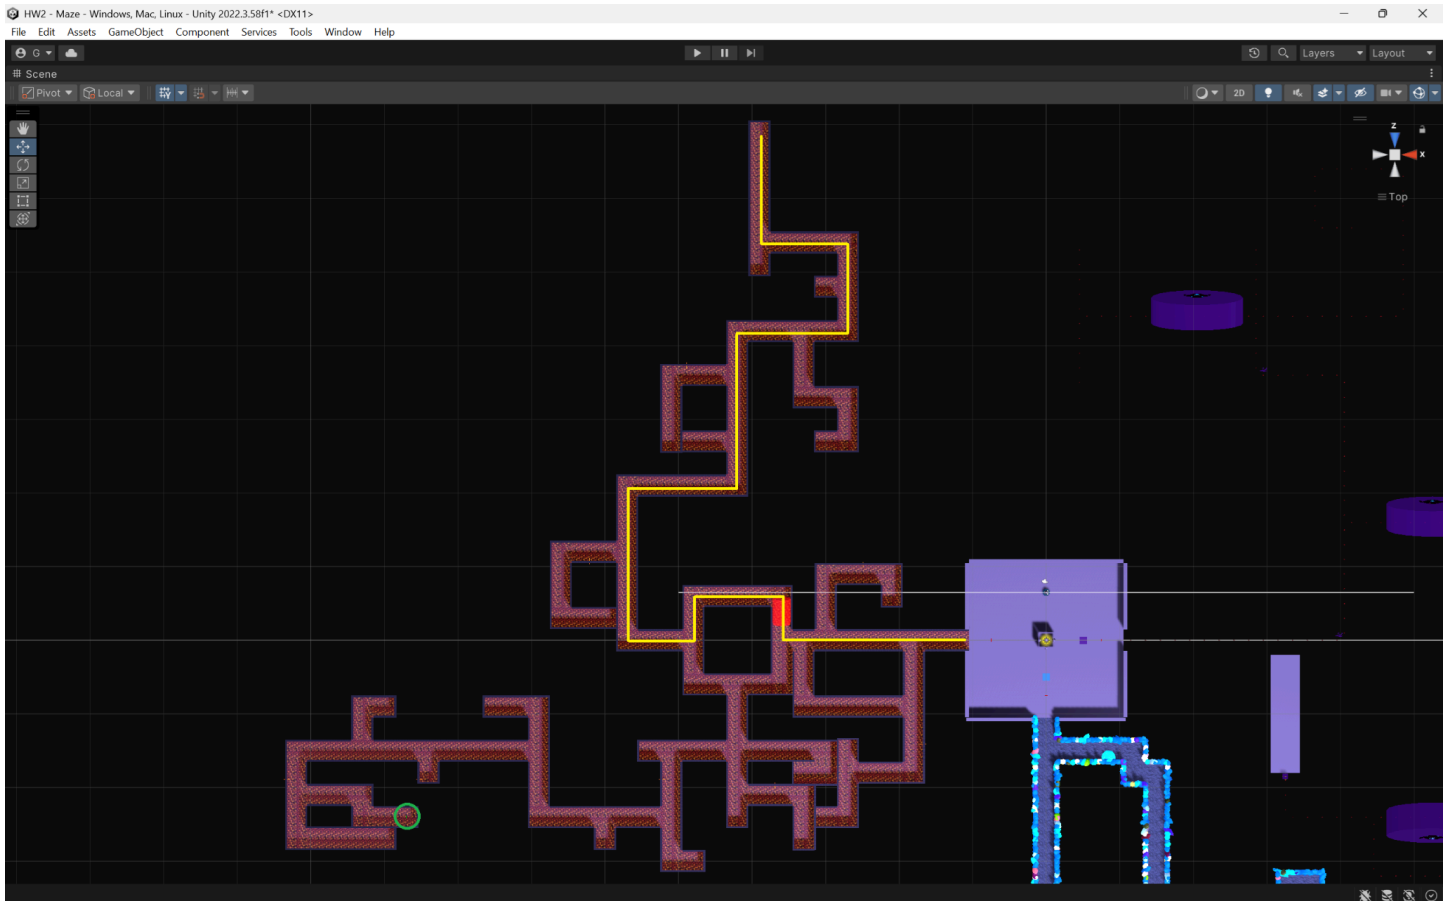

These traps move from left-to-right and right-to-left. It damages the player on colliding. The damage and speed varies from instance to instance—not randomized, will not change on each playthrough. Best strategy is to learn the timing by observing it and then try to pass it.

## Guard

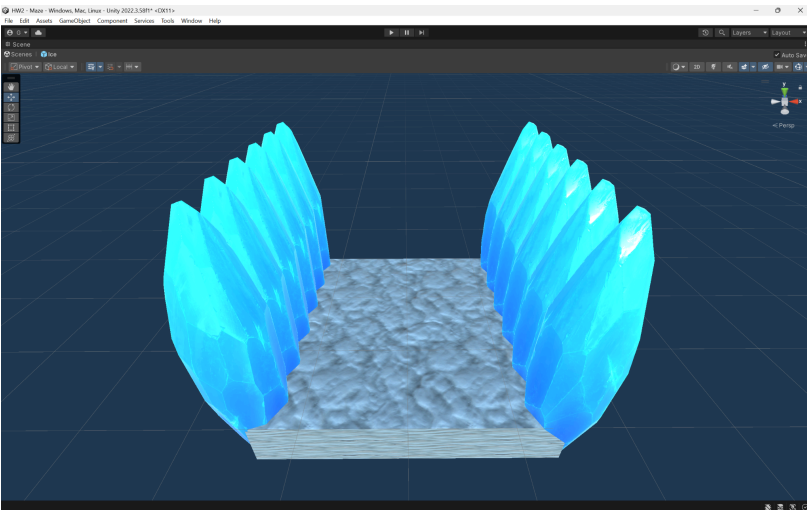

This guard both damages you and makes your mass 10'000. Since lava will hurt a slow player, getting caught by this guard will indirectly kill the player. The guard has a predetermined path that it loops continuously. But this guard is unable to detect the player if the player's velocity is less than 0.15 seconds. So the best strategy is to freeze as soon as you see the guard.

# Solution

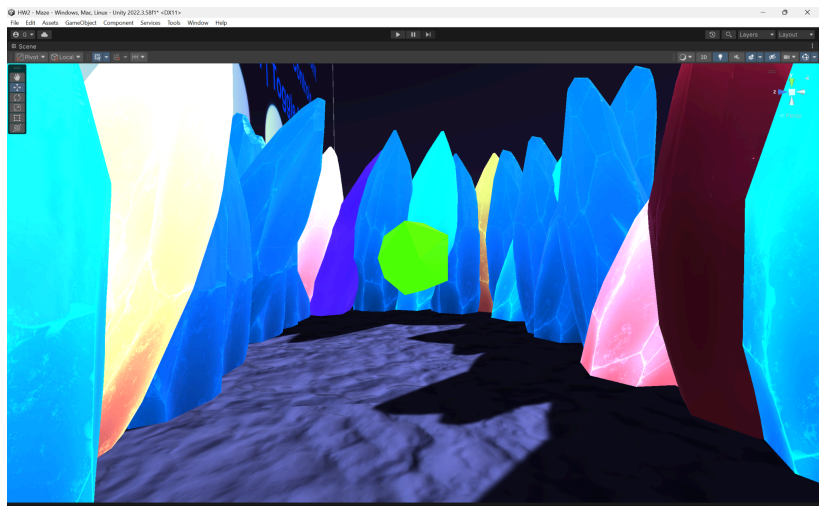

## Ice Segment

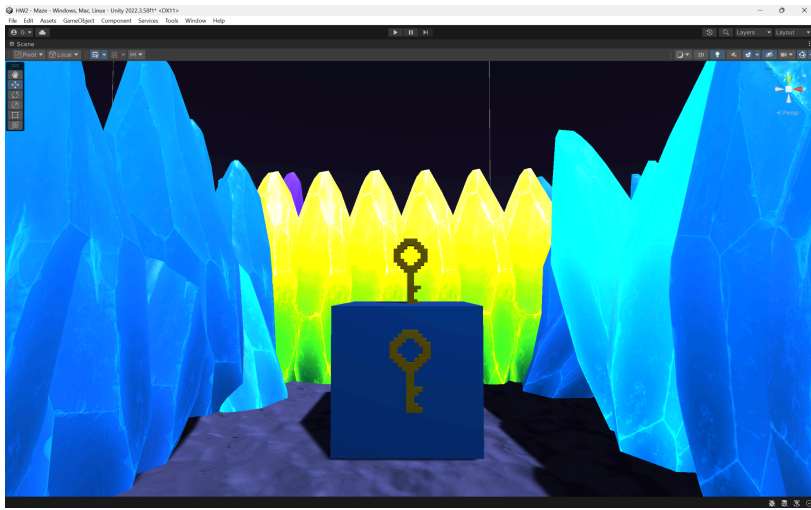

This segment is slippery. The player has higher max speed and rotation speed. It's much more difficult to control the player's movement here. I wanted to make this segment's walls feel more natural. So I also wrote a script that can randomize the crystal's colors and rotations in the editor.

## Keys

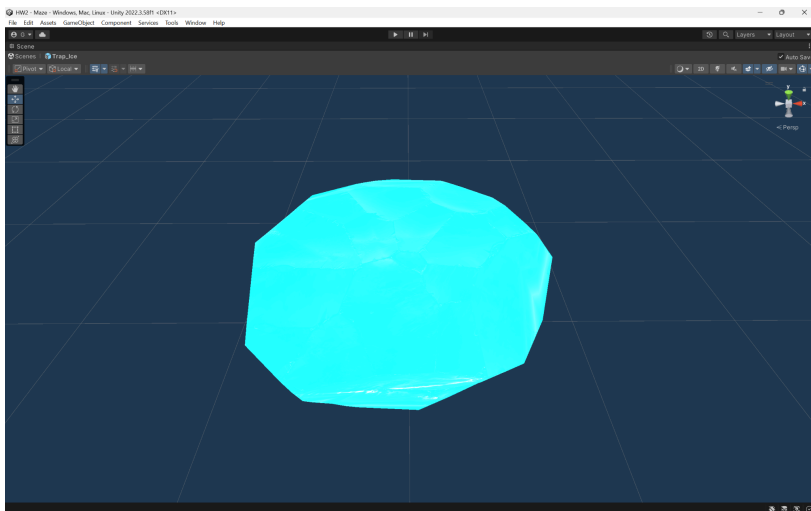

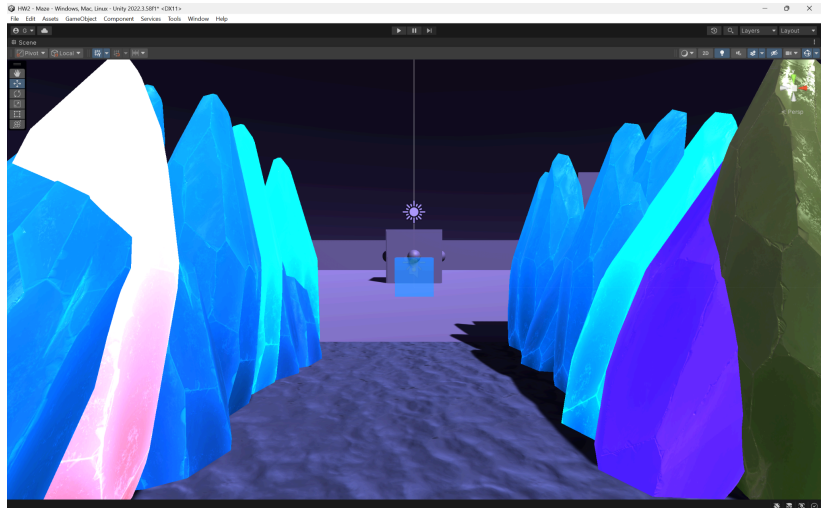

This is **not** the real key. This is the semi key. As you'll see in a moment, the real key is behind a wall that is accessible but this key lowers that door. Allowing the player to push the key through a shortcut.

The blue box is the keyslot. The key activates when it collides with the slot.

This is the real key. Its road to the keyslot is blocked by the green wall—which the semi key lowers. It's theoretically possible to push this key to its slot without using the shortcut, but it will take significantly more time.

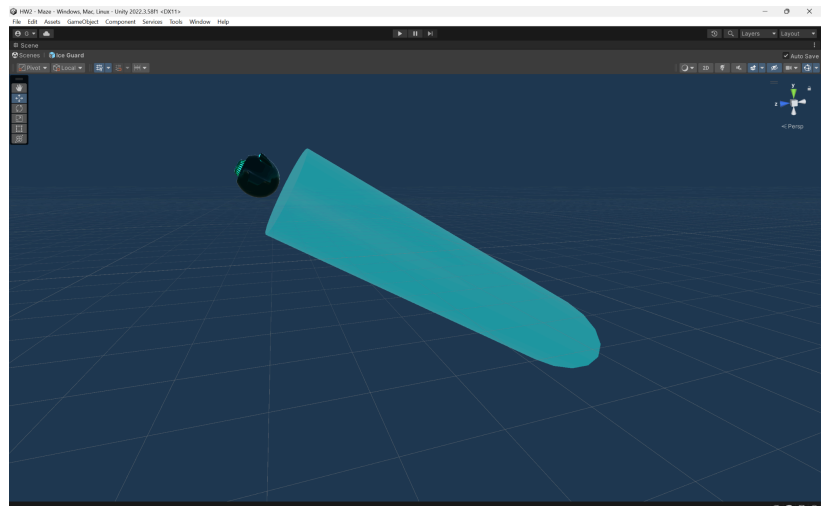

## Traps

The trap throws the player in a random direction with a random force while also damaging the player proportional to the randomized magnitude of the force. Best strategy is to try and avoid it.

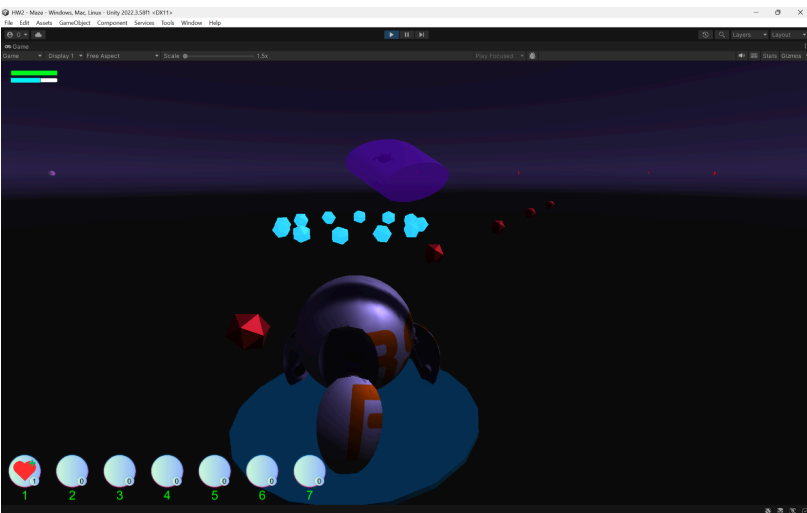

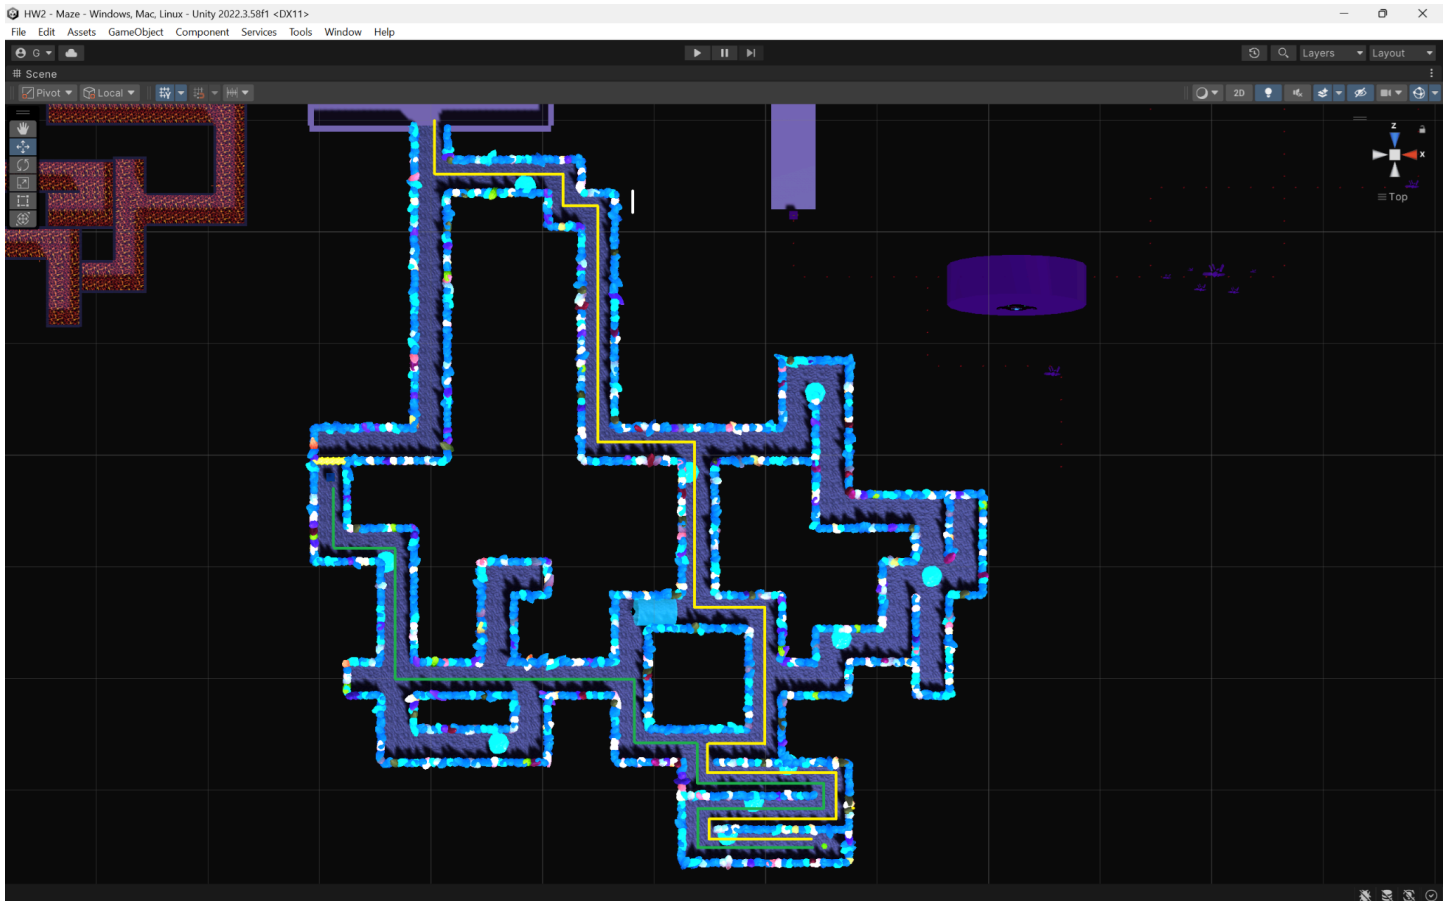

## Guard

This guard both makes you lighter and damages you. Getting lighter will make the movement even more difficult to control. Exiting and reentering the ice segment will make the mass return to normal. However, freezing doesn't work here. And like the lava guard, it has a looping predetermined route. Best strategy is to run from it.

# Solution

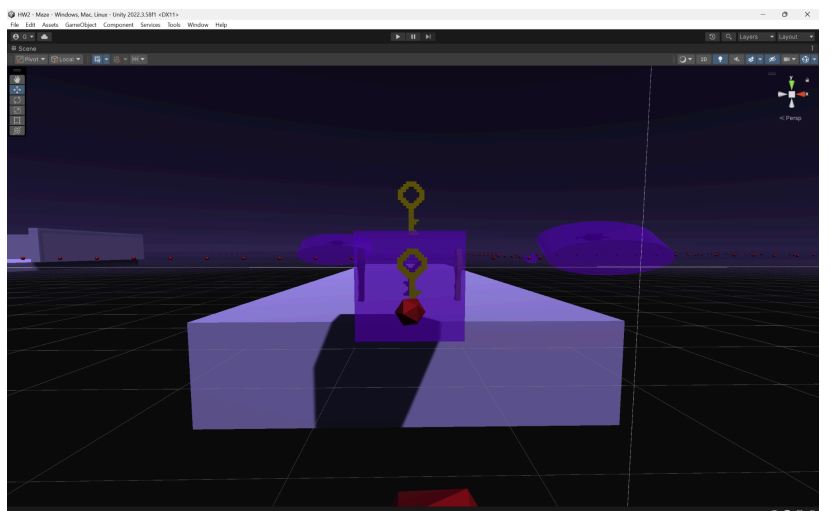

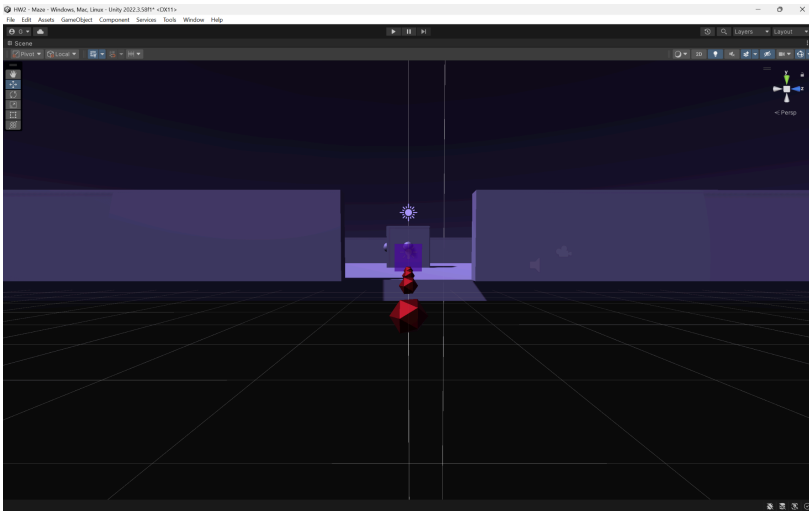

## Invisible Segment

This part has no walls. It's possible to fall down from the borders. The player has a navigator-like component for this segment. When the player activates it, the crystals light up. Crystals lighting up signals that there is a steppable invisible floor in the crystal's direction. This navigator has its own cooldown which automatically recharges when not used. This segment also has another helping component that I call *breadcrumbs*. 2 seconds after the player steps into a new floor, these red breadcrumbs appear. They help the player to trace back from deadends. This segment's paths are also wider. Other segments are 3x3, this one is 4x4. If you fall, you'll just get teleported to the beginning of the maze.

## Key

This key works in a similar way to the ice segment's. You need to push it to its slot. But the difference is, here the shortcut is automatically created on collision.

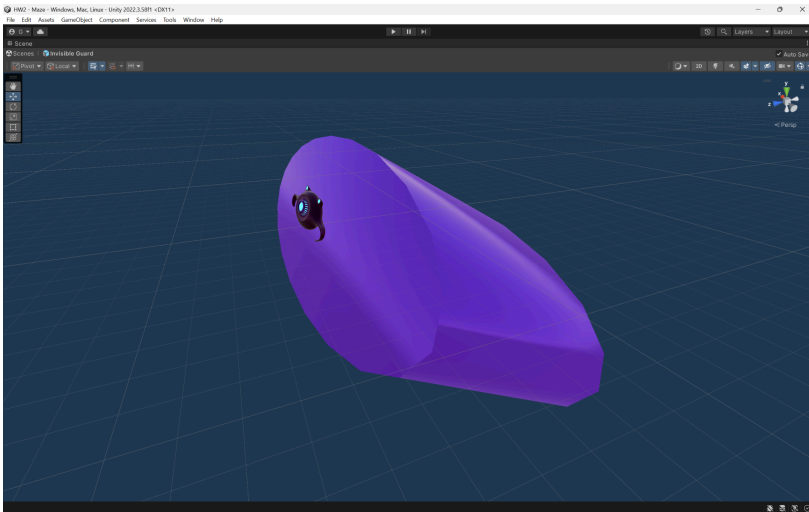

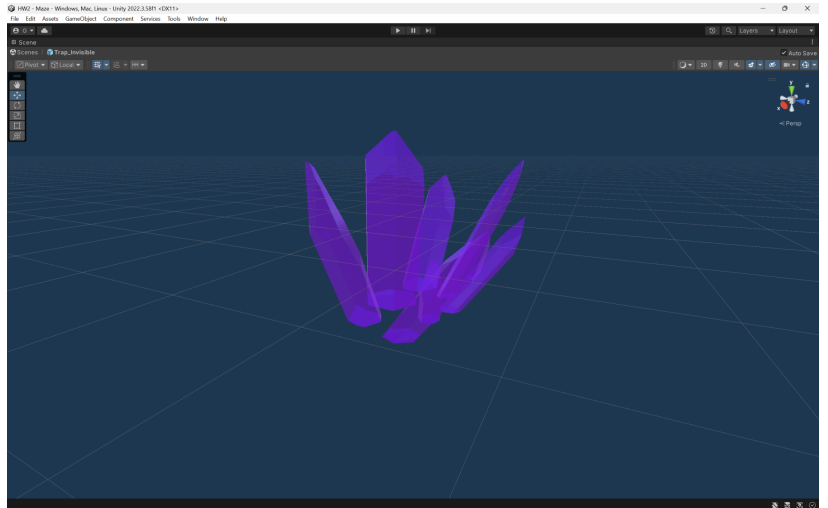

This purple cube is the keyslot. Same as the ice key, it activates the key when it collides with it.

## Trap

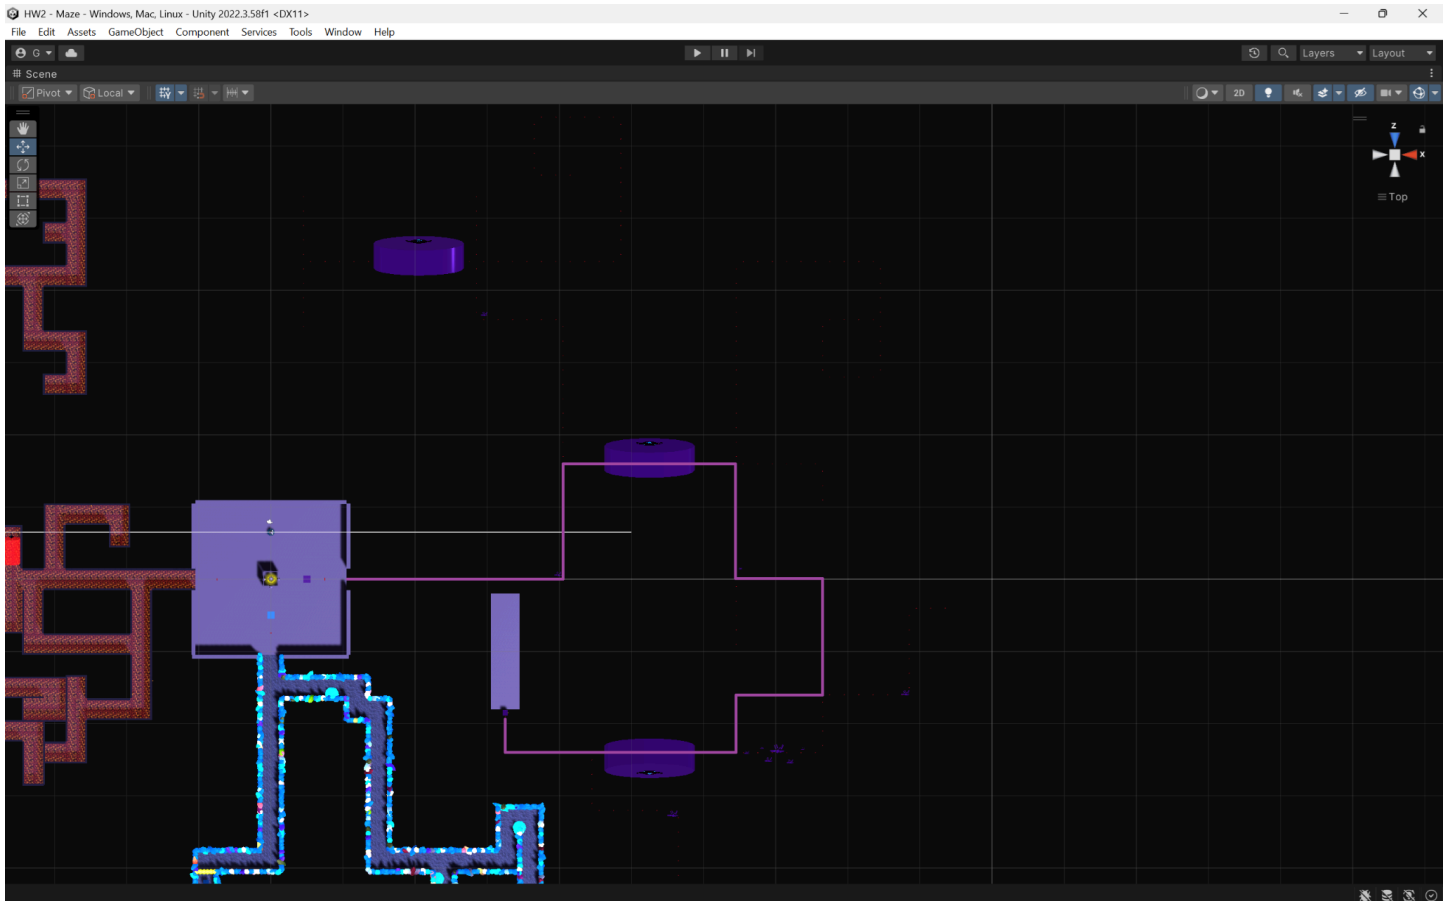

This trap is—like the maze—invisible at first. It becomes more visible when you get close to it. If you get too close, it teleports you to the start of this segment—while also damaging you. If you get teleported by this trap, you'll lose all the breadcrumbs.

## Guards

This guard is different from the other guards. They don't have a route. They are stationary. They can detect you if you look in their direction. Your only choice of action is to look at the direction the guard is looking—you can ignore the Y axis. If you walk sideways with your back on the guard—the robot part—the guard won't be able to see you. If the guard detects you, it will teleport you to the start of this segment—like the trap. This teleportation will also make every breadcrumb disappear.

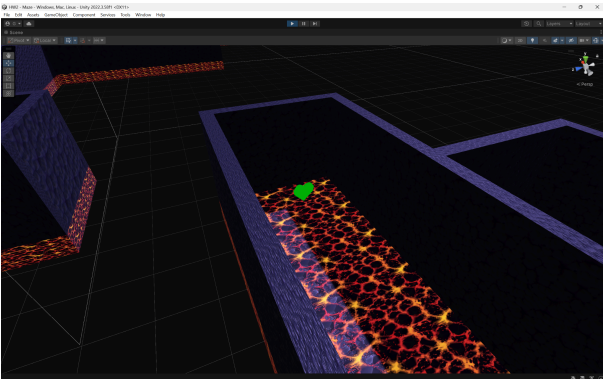

# Solution

## Pickups

There are 3 special pickups and 7 types of boosting pickups. Boosting pickups are activated with their corresponding key bindings—1 through 7, UI shows which is which. There are spawn points all over the map. The boosting pickups generated randomly on each playthrough on those spawn points. 3 special pickups are the lava segment's key, ice segment's semi-key and the regeneration pickup.

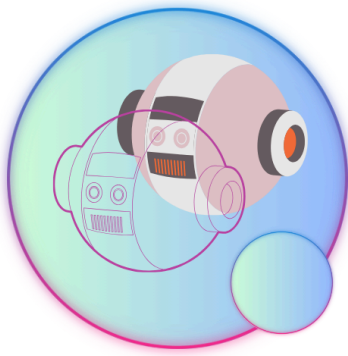

- The regeneration pickup allows the player to heal. It makes the game considerably easier.

- This pickup boosts players ability to regenerate. The effects won't be intelligible if the player didn't unlock regeneration via its pickup.

- This pickup increases the maximum amount of the player's navigator capacity.

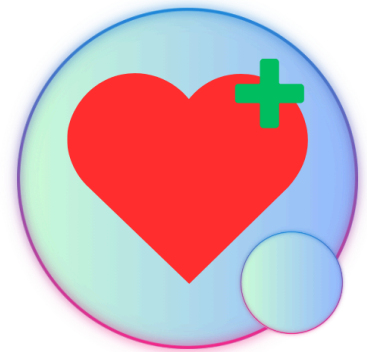

- This pickup allows the player to create a checkpoint. After it's activated, the player can teleport to that checkpoint with the 'Q' key. This is for one-per-pickup only. The player cannot teleport to the same checkpoint more than one time. This checkpoint also resets any effect on the player's mass. That's why this pickup is extremely useful if you get caught by lava or ice guards. This is the only feasible way to neutralize lava guard's effect on the mass.

- This pickup speeds up the cooldown process on the player's navigator.

- This pickup renders the player immune to every offensive action for a short period of time—10 seconds. Player cannot be harmed in any way, no trap can damage the player, no guard can detect the player.

- This pickup maxes out the player's health.

- This pickup increases the maximum amount of the player's health.

## Additional Notes

- There are multiple message spots that give the necessary hints to the player.
- Player loses if the player's health is 0.
- Player wins if the player successfully activates all 3 keys. After a few seconds the player wins, the UI kicks in to better show the fireworks.
- If the game proves too difficult to test, you can pause the game and move every key to the center piece. Then it should be easy-to-activate. After activation the walls in the center will descend.
- The "toggle music" feature does have a small animation-like system that makes the headphone mesh more visible and invisible over time.
